

Contoso TPS Report

- Resource B peak: There is a significant peak in latency of Resource B around 3AM, greatly exceeding the latencies of Resources A and C.
- General trend: Resource A & C show relatively stable latency periods. Resource B has a more volatile pattern.
- Resource C stability: Demonstrates the most stable latency, making it potentially the most reliable resource.
- Resource A increases: Shows a gradual increase, suggesting potential performance degradation.
- Midnight activity: Latency for all resources is lower at midnight and starts to increase through the early morning hours.
- Anomalies: The sharp spike in latency for Resource B at 3AM is a notable anomaly.
- Trends: The gradual increase in latency for Resource A indicates a potential trend.
